

Takuya Kurihana

tkurihana@uchicago.edu Chicago, IL

Skills Python, Fortran 90/95, C, C++, C#, MPI, OpenMP, Shell Script, MySQL, Java, HTML, SciLab, Matlab, Go, Microsoft Office, Latex, Jira, Git.

ML/DL libraries Tensorflow, Keras, Pytorch, Horovod, Scikit-learn, Spark-mllib

Libraries AWS (EC2, DynamoDB, Lambda, S3, AutoScaling), Spark, Kubernetes, Docker, Parsl, Pachyderm, Dask

EDUCATION

University of Chicago

Chicago, IL

PhD in Computer Science GPA 3.60

June 2023 (expected)

- **Research area:** Deep learning (Unsupervised-/Semi-supervised learning application in climate science), Machine learning, Clustering, High performance computing. Cloud dynamics.

Develop the rotation-invariant optimization function to improve feature representation in autoencoder. The rotation-invariant feature improves clustering of object patterns and textures regardless of their orientation of inputs without any assumptions concerning artificial categories, addressing misclassification depended on their rotations of object.

Develop unsupervised cloud clustering framework to train and test 20TB MODIS satellite products, discovering >10 intermediate cloud categories underexplored in conventional cloud classifications.

These research outputs are summarized into two papers accepted in Climate informatics 2019 and Arxiv(under review by IEEE Transactions on Geoscience and Remote Sensing)

- **Honors:** Heiwa Nakajima Global Scholarship, American Geophysical Union Outstanding Student Presentation Awards

MS in Computer Science GPA 3.60

December 2020

- **Specializations:** (1) Distributed tensorflow training, (2) Neuromorphic computing, (3) Auto-scaling strategies, (4) Deep learning on IoT device

(1) Benchmark task for distributed tensorflow over three cluster computers. Evaluate impact of TCP /IP network configuration (jitter, latency and packet loss) on the distributed tensorflow training.

(2) Coded a spiking based unsupervised neural network on neuromorphic computing simulator. Use a hand-digits dataset (MNIST) to analyze different spiking signals on their bottleneck layer via PCA, revealing that different digit-class shows different spiking patterns.

(3) Developed automatic scaling strategies aiming at efficient resource managements for a Python parallel scripting library (Parsl). The strategies improved the resource utilization by 30% by the reallocation of resources at unnecessary workers.

(4) Modified tensorflow, Bazel and OS applications for ARM ODROID XU4 to deploy trained deep learning models. Code a Python wrapper for C/C++ energy consumption library, and evaluate consumed energies by different kernels.

University of Tsukuba

Tsukuba, Japan

MS in Meteorology GPA 3.92

March 2021

- **Specializations:** Data assimilation, Numerical optimization, Numerical weather prediction.

Developed a satellite-observation pre-processing algorithm that reduced the computation time by 98% than that of greedy algorithm against dense satellite observations.

Evaluated the impact of multiple pre-processing algorithms to assimilated results, showing that the proposed outperformed the error statistics in analysis.

University of Tsukuba

Tsukuba, Japan

BS in Meteorology GPA 3.60

March 2017

- Rice University, Research Internship Program, August–September, 2016
- University of California Berkeley, Summer program, June–August, 2015
- Honors: Nakatani - RIES Foundation Fellowship, Best Presentation Awards in International Student Science Forum Ho Chi Minh City, Second Presentation Prize in Urayasu City English Presentation Competition

EXPERIENCE

Woven Planet Holdings

Software engineer

Tokyo, Japan

July – October, 2021

- Conduct benchmarks and optimization of the high-definition map pipeline

Developed a benchmark tool running in a Kubernetes with Prometheus that measured the throughput from the high-definition map (HD map) creation pipelines. Conducted extensive amount of experiments to investigate bottleneck of pipelines, optimizing the configuration of production workflow using ~200TB of satellite imagery.

- Develop dynamic autoscaling operator

Developed and deployed an autoscaler as a Kubernetes operator that adjusts the number of k8s pods based on performance of pipelines. This autoscaler addressed suboptimal pipeline performances especially when multiple pipelines are competing the cloud resources. There is no conflict with the cloud native autoscale policy, e.g., AWS AutoScaler, as the scope of proposed autoscaler dynamically allocate optimal number of k8s pods of different pipelines running concurrently on cluster computers. The operator increased the efficiency of resource allocation by at most 500%.

Japan Meteorological Research Institute

Research Assistant

Tsukuba, Japan

June, 2016–July, 2018

- Study on uncertainty of cumulonimbus initiation and development using particle filter

Developed parallelized Python analytical tools for dual-polarization doppler radar observation for statistical tests and assimilated simulation results.

Researched the observation error correlation in doppler radar products and simulations; Presented the results at Japan Meteorological Society 2018.

- Study on the optimal perturbation method for ensemble data assimilation

Researched impacts of off-diagonal elements in transform matrix under the ensemble transformation of ensemble Kalman filter via conducting observing system simulation experiments (OSSE) on SPEEDY-LETKF for 50 ensemble members. I contributed to present the results for several peer-reviewed conferences and published into a book.

Developed Fortran95/bash-script tools for spectrum analysis, perturbation technique, and ensemble analysis for OSSE results.

Mitsubishi UFJ Morgan Stanley Securities
Financial Engineer

Tokyo, Japan
February–March, 2017

Researched weak-/strong-scaling experiments on 10 000 cores to optimize performance of a bond option pricing model

Developed an computation-time efficient algorithm for derivative price computation, and reduced the computation time by 50%.

Mizuho Securities
Quantitative Analyst

Tokyo, Japan
August, 2017

Researched case studies of volume weighted average price (VWAP) for derivative option pricing.

RIKEN Advanced Institute for Computational Science
Graduate Research Assistant

Kobe, Japan
July–August, 2017

Developed a super-observation (aggregation of dense observation to the nearest grid point of numerical simulation) algorithm to accelerate aggregation of NASA Global Precipitation Measurement product for the Nonhydrostatic ICosahedral Atmospheric Model (NICAM) i.e., find a closest grid location against a satellite observation among $O(100\,000)$ and more number of grid points. The adaption of computing efficient superobservation approach allows NICAM to simulate more realistic precipitation estimation.

Rice University
Research Assistant

Houston, TX
August–September, 2016

Developed Kalman filter and expectation-maximization algorithm for a diffusion-advection nonlinear partial differential equation

ACTIVITIES

Teaching Assistant

Chicago, IL

- Teaching assistant for Computer Science with Applications 2 January–March, 2021

Manage two laboratory classes up to 40 undergraduate students to instruct python (pandas, matplotlib), web-scraping, regular expression, bashscript, database and algorithms. Hold office hours and question dashboard to assist students about class materials.

- Teaching assistant for Cloud computing April–June, 2020

Instruct Amazon web service (EC2, Lambda, EBS, DynamoDB) and open office hours to assist up to 60 master students.

Internship mentor

Chicago, IL

Summer student supervisor

- Student mentor in METCALF program June–September, 2020
Supervised one undergraduate student to build an image annotation tool based on CVAT library for MODIS calibrated radiance product..
- Student mentor in Center for Data and Computing program June–September, 2019
Supervised one master and two undergraduate students to develop automation libraries of MODIS satellite produces' pre-processing for unsupervised cloud clustering.
Supervised an undergraduate student to compare clustering analysis (HAC, K Means++, Spectral, and DBSCAN) for outputs from our developed cloud classification framework.
